

Project Title: GMart – E-Commerce Sales & Revenue Analysis Using Microsoft Excel

Project Objective:

The objective of this project is to analyse **GMart's e-commerce sales data** to understand overall business performance, identify **high- and low-performing products, categories, regions and store types**, and understand **customer and payment preferences**. The analysis aims to identify key business opportunities and provide **actionable insights to improve sales, customer engagement, inventory planning and overall business growth**.

Dataset Description:

The dataset consists of **4 tables: 3 Dimension Tables and 1 Fact Table**.

- **Customer_Dim** – Contains customer-related information such as Customer ID, Name, Gender, City, State, Country, and Loyalty Level.
- **Product_Dim** – Contains product-related information such as Product ID, Product Name, Category, Sub-Category, Brand, Cost, and Stock.
- **Store_Dim** – Contains store-related information such as Store ID, Store Name, Region, City, and Store Type.
- **Sales_Fact** – Contains transactional sales data such as Order Date, Customer ID, Product ID, Store ID, Quantity, Unit Price, Discount %, and Total Amount.

Overall Structure: 3 Dimension Tables + 1 Fact Table = **Star Schema**.

Data cleaning & transformation:

Used Excel functions such as ***IF, SUBSTITUTE, RIGHT, MID, LEN, CONCATENATE, ISBLANK, TRIM, CLEAN, and PROPER, XLOOKUP, VLOOKUP*** along with ***Find & Replace***, to clean, standardize, and transform the data. Identified and replaced blank values with ***Zero***, standardized IDs, names, and categorical values, and created calculated columns such as ***Selling Amount, Discount Amount, and Sales After Discount***.

Visualization and Insights Arrived with screenshot of visualization

Report/Dashboard screenshot:

- **Descriptive Analysis:**
GMart generated approximately **2.17 million in revenue from 4,964 units sold**, showing a strong overall sales foundation. **2024 was the strongest full year**, generating approximately **1.09 million in revenue**, while revenue declined to approximately **856.67K in 2025**, indicating a slowdown in overall sales performance.
- **Diagnostic Analysis:**
The decline in 2025 can be further understood by analyzing **quarterly performance, regions, stores, categories, products, customer behaviour, and discounting patterns**. Identifying underperforming areas will help management determine the key factors contributing to the revenue decline.
- **Predictive Analysis:**
If the declining trend continues, GMart may experience further pressure on future revenue. Historical **quarterly, category, regional, and store-level trends** can be used to anticipate future sales performance and support better planning of inventory, promotions, and sales targets.
- **Prescriptive Analysis:**
GMart should focus on **high-performing products and categories**, improve underperforming stores and regions through targeted strategies, strengthen customer loyalty with personalized offers, optimize discounts to protect revenue and profitability, and use customer and payment-method insights to improve the overall purchasing experience.

Conclusion:

I successfully analysed and transformed the GMart sales data using Excel, applying aggregation functions, data cleaning, text formatting, conditional formatting, PivotTables, and charts to derive meaningful business insights.
